## 2 SRR1039509 treated   N61311 GSM1275863
## 3 SRR1039512 control  N052611 GSM1275866
## 4 SRR1039513 treated  N052611 GSM1275867
## 5 SRR1039516 control  N080611 GSM1275870
## 6 SRR1039517 treated  N080611 GSM1275871
```

How many genes are in this dataset?

```
nrow(counts)
```

```
## [1] 38694
```

How many control cell lines do we have?

```
sum(metadata$dex=="control")
```

```
## [1] 4
```

First I need to extrat all the control columns. Then I will take the rowwise mean to get the average count values for all genes in these four experiments.

```
control.inds <- metadata$dex == "control"
control.counts <- counts[,control.inds]
head(control.counts)
```

```
##                 SRR1039508 SRR1039512 SRR1039516 SRR1039520
## ENSG00000000003        723        904       1170        806
## ENSG00000000005          0          0          0          0

## ENSG00000000457        347        364        318        330
## ENSG00000000460         96         73        118        102
## ENSG00000000938          0          1          2          0
```

```
control.mean <- rowMeans(control.counts)
```

Do the same thing for "treated".

```
treated.inds <- metadata$dex == "treated"
treated.counts <- counts[,treated.inds]
head(treated.counts)
```

```
##                 SRR1039509 SRR1039513 SRR1039517 SRR1039521
## ENSG00000000003        486        445       1097        604
## ENSG00000000005          0          0          0          0
## ENSG00000000419        523        371        781        509
## ENSG00000000457        258        237        447        324
## ENSG00000000460         81         66         94         74
## ENSG00000000938          0          0          0          0
```

```
treated.mean <- rowMeans(treated.counts)
```

We are cominbining the data from both means into a dataframe.

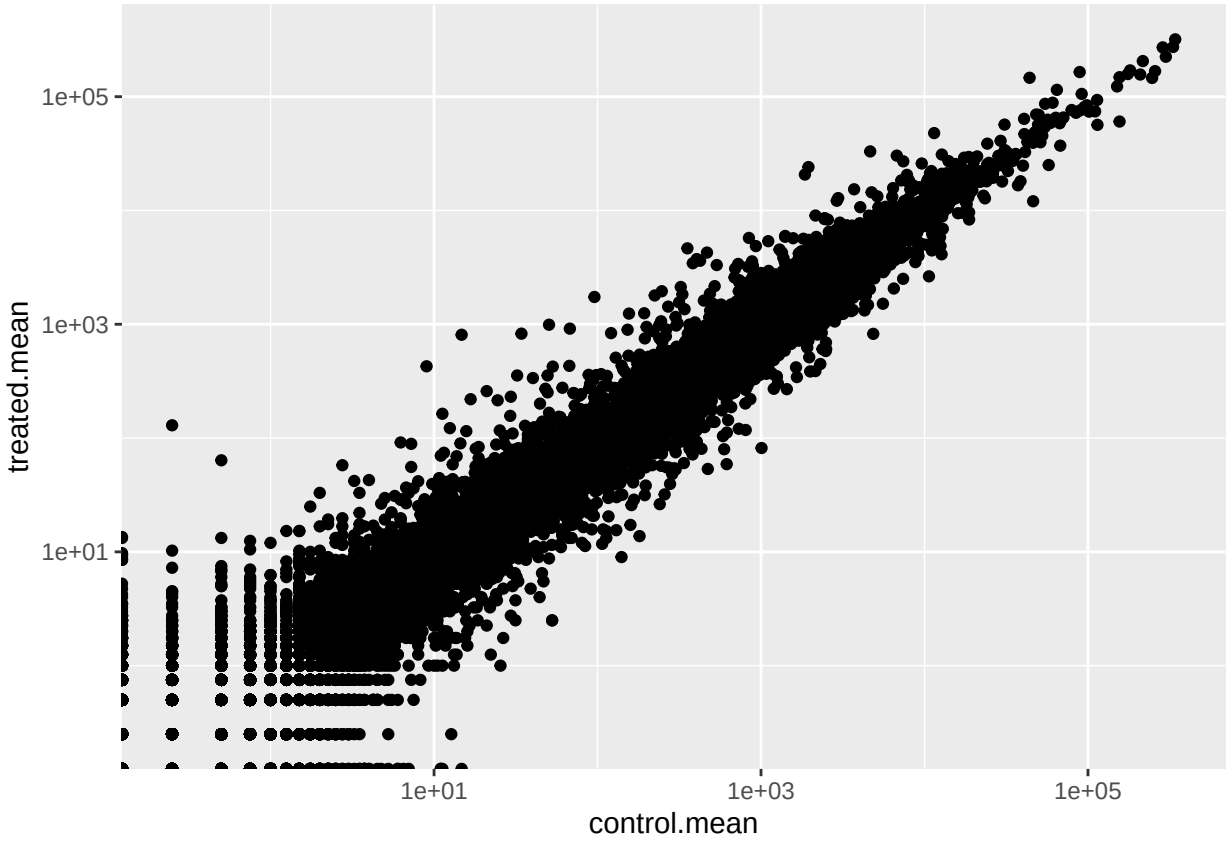
```
meancounts <- data.frame(control.mean, treated.mean)
```

Plot control vs treated

```
library(ggplot2)
ggplot(meancounts, aes(x = control.mean, y = treated.mean)) + geom_point() + scale_x_log10() + scale_y_
```

```
## Warning: Transformation introduced infinite values in continuous x-axis
```

```
## Warning: Transformation introduced infinite values in continuous y-axis
```



```
log2(10/10)
```

```
## [1] 0
```

```
log2(40/10)
```

```
## [1] 2
```

```
log2(5/10)
```

```
## [1] -1
```

We see 0 values for no change, positive vales for increased expression, and negative values for decreased expression. **log2(fold-change)** is used a lot in genomics/proteomics.

```
meancounts$log2fc <- log2(meancounts[,"treated.mean"]/meancounts[,"control.mean"])
head(meancounts)
```

```
##                 control.mean treated.mean      log2fc
## ENSG00000000003       900.75       658.00 -0.45303916
## ENSG00000000005         0.00         0.00         NaN
## ENSG00000000419       520.50       546.00  0.06900279
## ENSG00000000457       339.75       316.50 -0.10226805
## ENSG00000000460        97.25        78.75 -0.30441833
## ENSG00000000938         0.75         0.00        -Inf
```

We have to get rid of the genes (rows) with 0.00 counts because we can't say anything about these; they have no data.

```
head(meancounts[,1:2]==0)
```

```
##                 control.mean treated.mean
## ENSG00000000003        FALSE        FALSE

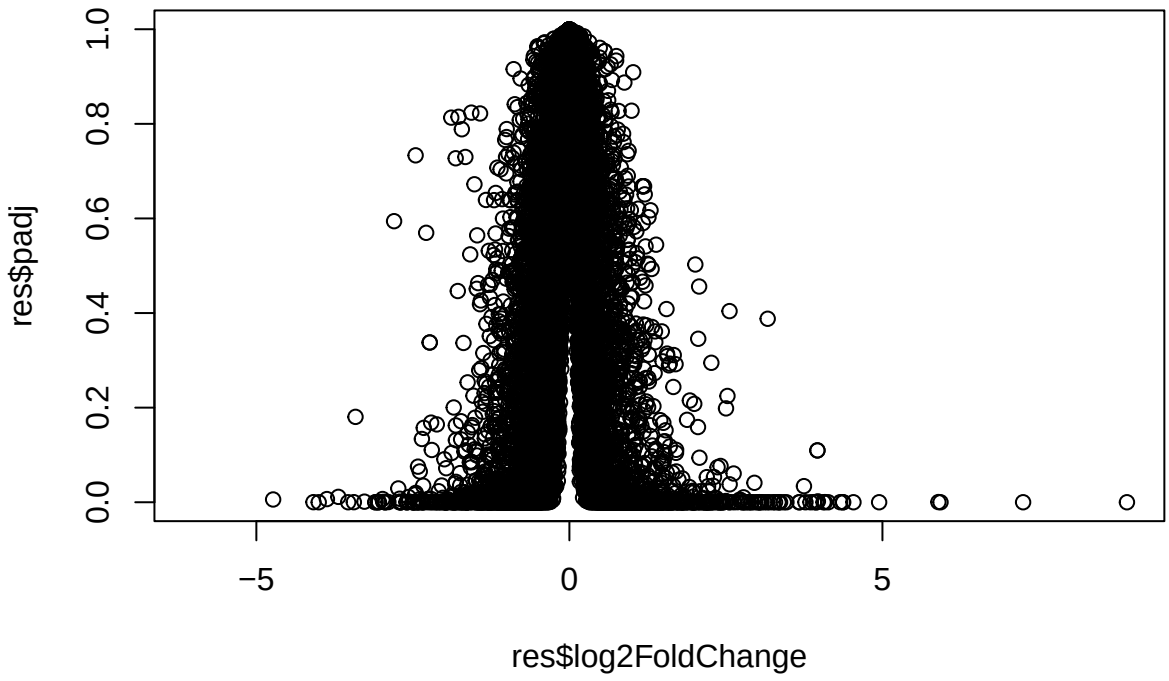
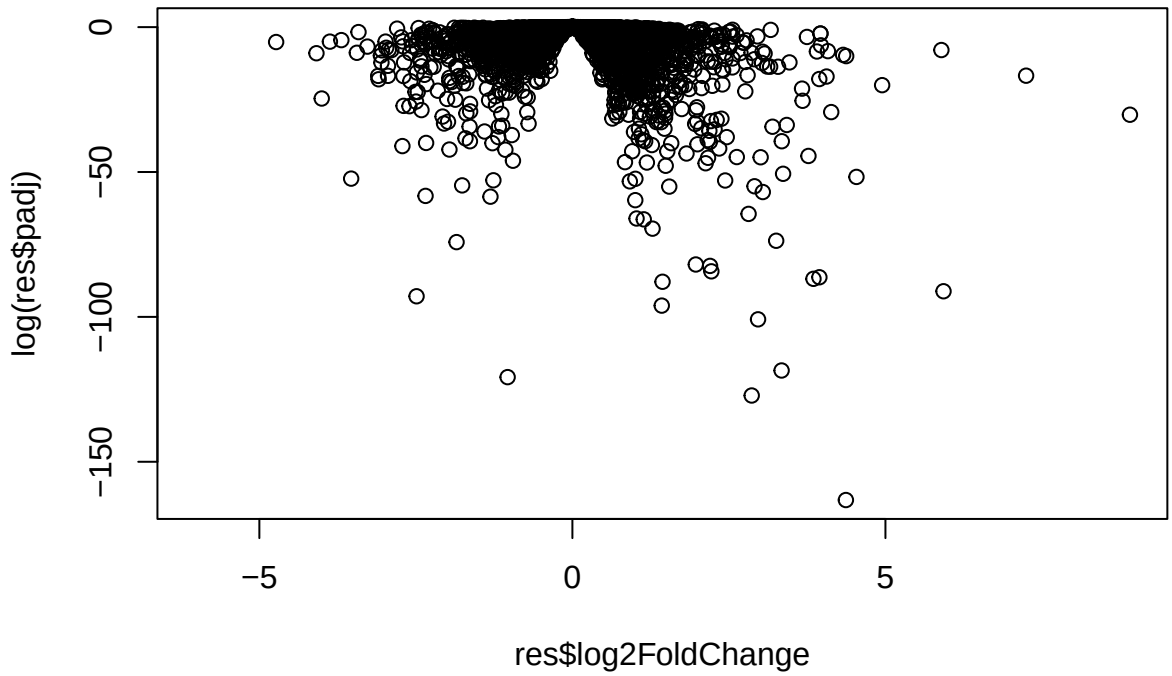
VOLCANO PLOTSSSSS

```
plot(res$log2FoldChange, res$padj)
```



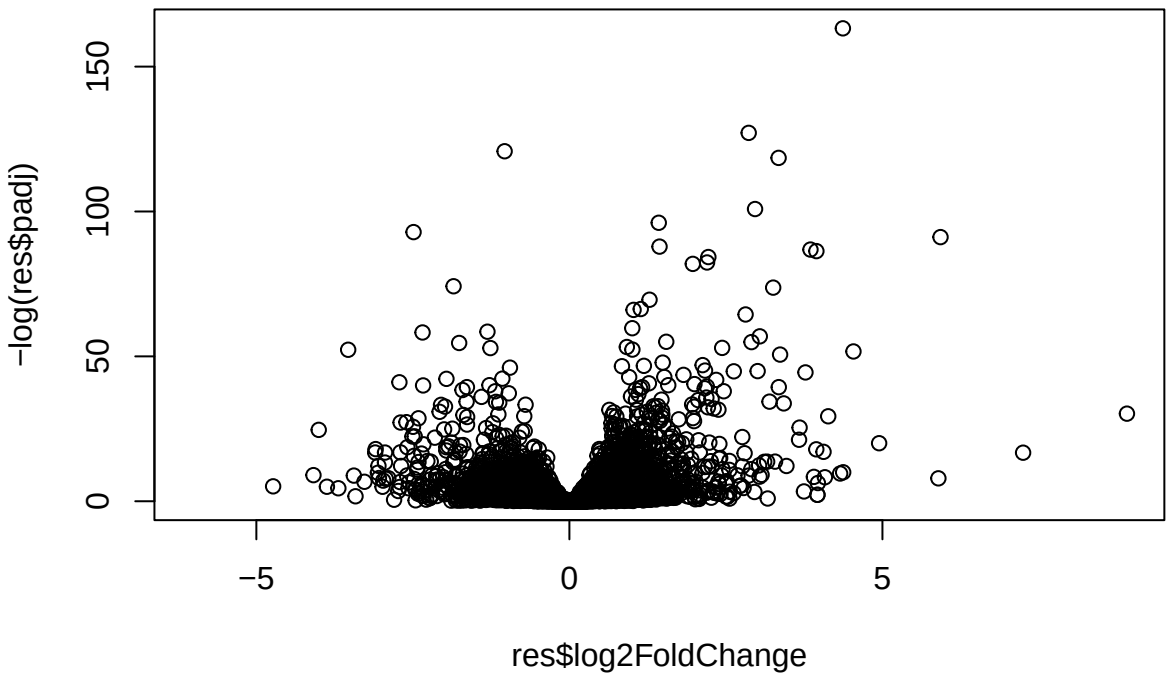
That was not a usefall plot because al the small p-values are hidden at the bottom of the plot and we can't see them very well. Log can help

```
plot(res$log2FoldChange, log(res$padj))
```



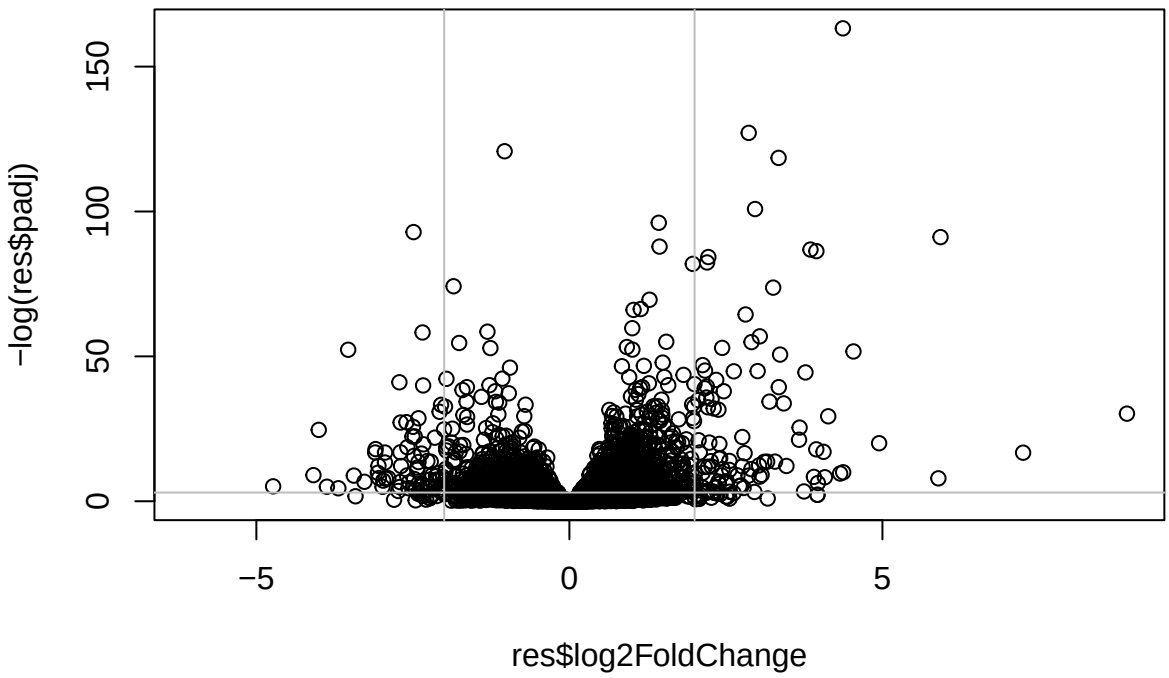
We can flip this p-value axis by putting a minus sign on it, giving us a classic volcano plot.

```
plot(res$log2FoldChange, -log(res$padj))
```



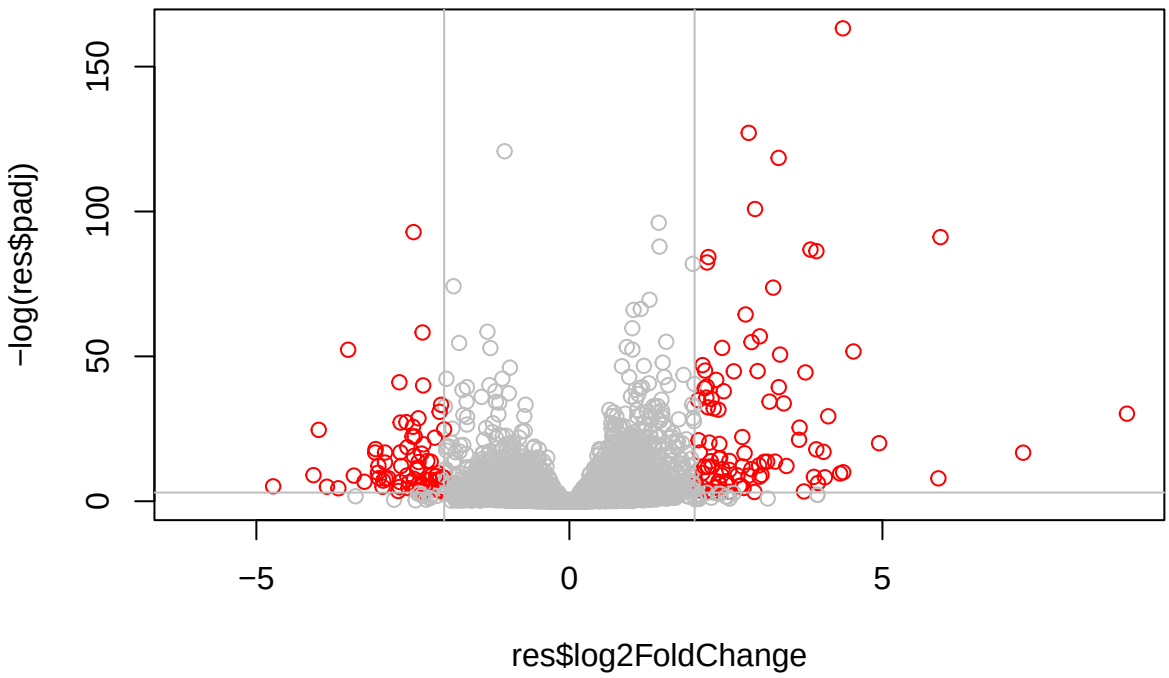
Let's make our plot pretty by adding color to draw attention to the genes we care about- the points with large fold-change and small p-values (high -log values)

```
plot(res$log2FoldChange, -log(res$padj))
abline(v=c(-2, +2), col= "gray")
abline(h=-log(0.05), col="gray")
```



```
mycols <- rep("gray", nrow(res))
mycols[abs(res$log2FoldChange)>2] <- "red"
mycols[res$padj>0.05] <- "gray"
```

```
plot(res$log2FoldChange, -log(res$padj), col=mycols)
abline(v=c(-2, +2), col= "gray")
abline(h=-log(0.05), col="gray")
```



−log(res$padj)
